PROTOTYPE EXPLANATION

PoiseAtHome

A screen-and-workflow guide for the home salon booking and

management system of Poise Hair Center Salon.

Prepared from the implemented React frontend and Laravel API

22 August 2026

1. Public and Authentication Experience

Landing and service catalog

The public experience introduces home salon appointments directly. Visitors can browse active service categories, view duration and price, open a service detail, and begin booking without seeing internal salon data.

Authentication

Registration collects customer account details and leads to six-digit email verification. Sign in uses the existing email and password flow. Forgot Password sends a separate six-digit recovery code and requires short-lived backend authorization before a new password can be accepted.

Design intent

The interface uses the permanent light theme and restrained purple/magenta brand identity. Technical diagrams in this documentation remain monochrome by request.

2. Customer Experience

Five-step booking flow

1. **Service:** choose an active home-service offering.
2. **Hairstylist:** choose an active, qualified professional.
3. **Date and Time:** select a calculated available slot.
4. **Home-Service Details:** provide the service location and relevant notes.
5. **Review:** confirm schedule, price, duration, address, and required downpayment.

After booking

The success view presents the appointment number, summary, and next payment action. Appointment detail groups schedule, hairstylist, home-service location, payment state, and lifecycle state. Payment submission clearly states that proof is reviewed manually.

Privacy

Customers can access only their own appointments, payments, proofs, and notifications.

3. Hairstylist Workspace

The staff workspace prioritizes daily operational work instead of business-wide analytics.

Screen
Dashboard
Schedule
Appointment detail
Products Used
Availability/Profile
My Reports

> Workflow actions follow the allowed appointment state order. Inventory changes and reversals are validated and transacted by the API.

4. Administrator Workspace

Area
Overview
Appointments
Payments
Services and Staff
Inventory
Reports & Analytics

Administrator actions remain behind role middleware. Export formats follow the same authorization as their JSON report sources.

5. Shared Interaction Rules

- Every major view provides a loading, error, and empty state where relevant.

- Critical forms disable repeat submission while a request is active.
- Status badges combine text with semantic styling; color is not the only signal.
- Tables scroll internally or become stacked presentations on narrow screens instead of overflowing the page.
- Menus, dialogs, and controls include labels, focus visibility, and keyboard behavior.
- Money uses Philippine peso formatting; customer-facing dates use Asia/Manila presentation.
- Raw server exceptions, file paths, and private proof locations are never shown as normal UI content.

Prototype fidelity

The prototype uses live API data and existing application routes. It does not introduce mock dashboards, fake reviews, fabricated metrics, or decorative content that is not supported by the business system.
